

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A nozzle assembly for a dishwasher having first and second racks for holding items to be washed, the nozzle assembly including:

a fixed central piece; and

a first nozzle rotatably provided proximate to the first rack and rotatably coupled to the fixed central piece, wherein the first nozzle is ~~configured~~ rotatable about a horizontal axis thereof so as to selectively spray washing fluid in a first rack direction in a first mode, and in a second rack direction in a second mode.

2. (Currently Amended) The nozzle assembly as claimed in claim 1, further comprising a fluid circulating means in communication with the first nozzle, wherein the fluid circulating means ~~is configured to supply~~ supplies washing fluid under pressure to the first nozzle for spraying therethrough, and ~~to rotate~~ wherein the fluid under pressure rotates the first nozzle about a vertical axis of rotation ~~by the pressure of the supplied washing fluid~~.

3. (Currently Amended) The nozzle assembly as claimed in claim 2, wherein the fixed central piece has two open ends, and wherein the first nozzle comprises[[:]]

Reply to Office Action of February 9, 2007

~~piece in communication with the fluid circulating means, the fixed central piece having two open ends;~~ and first and second nozzle sections in communication with the fixed central piece, wherein the first and second nozzle sections each have a closed end and an open end, and wherein the open end of each nozzle section is rotatably coupled to one of the two open ends of the fixed central piece.

4. (Currently Amended) The nozzle assembly as claimed in claim 3, wherein changing from the first mode to the second mode is done by rotating the first and second nozzle sections about a respective horizontal axis thereof.

5. (Previously Presented) The nozzle assembly as claimed in claim 3, wherein the fixed central piece and the first and second nozzle sections are symmetrical about a vertical plane passing through a central axis of the fixed central piece.

6. (Previously Presented) The nozzle assembly as claimed in claim 3, wherein a manual rotation of one of the first and second nozzle sections about a horizontal axis of rotation causes a corresponding rotation of the other of the first and second nozzle sections.

7. (Previously Presented) The nozzle assembly as claimed in claim 3, wherein the first nozzle further comprises a pair of O-rings respectively installed at connecting surfaces between the fixed central piece and the first and second nozzle sections.

8. (Previously Presented) The nozzle assembly as claimed in claim 7, wherein the open ends of the fixed central piece each have a stepped surface configured to receive one of the pair of O-rings.

9. (Previously Presented) The nozzle assembly as claimed in claim 7, wherein the pair of O-rings are made of a rubber based material so as to prevent leakage at the connecting surfaces and to resist rotation during operation of the nozzle assembly.

10. (Previously Presented) The nozzle assembly as claimed in claim 1, further comprising a second nozzle rotatably provided proximate to the second rack, wherein the second nozzle is configured to direct washing fluid toward the second rack.

11. (Previously Presented) The nozzle assembly as claimed in claim 10, further comprising fluid circulating means in communication with the second nozzle, wherein the fluid circulating means is configured to supply washing fluid under pressure to the second nozzle for spraying therethrough, and to rotate the second nozzle by the pressure of the supplied washing

fluid.

12. (Previously Presented) The nozzle assembly as claimed in claim 10, wherein the first and second racks are top and bottom racks, respectively, and the first and second nozzles are top and bottom nozzles, respectively.

13. (Previously Presented) The nozzle assembly as claimed in claim 10, wherein the first and second nozzles are disposed substantially parallel to the first and second racks, respectively.

14. (Currently Amended) The nozzle assembly as claimed in claim 1, wherein the first nozzle includes a first side and a second side, and wherein a plurality of injection holes are formed in the first side so as to spray washing fluid upward toward the first rack in the first mode, and to spray washing fluid downward toward the second rack in the second mode when the first nozzle is rotated about ~~a~~the horizontal axis so as to change an orientation of the holes.

15. (Currently Amended) The nozzle assembly as claimed in claim 1, wherein the first nozzle is configured to rotate 180 degrees about ~~an~~the horizontal axis of rotation of the first nozzle.

16. (Previously Presented) The nozzle assembly as claimed in claim 3, wherein each of the first and second nozzle sections has first and second surfaces extending between their respective open and closed ends, and wherein the first surface of each of the first and second nozzle sections each include a plurality of holes in fluid communication with the fixed central piece via the open ends of the first and second nozzle sections and the fixed central piece.

17. (Previously Presented) The nozzle assembly as claimed in claim 1, wherein the washing fluid is water, detergents, soil particles, or any combination thereof.

18. (Previously Presented) A dishwasher comprising the nozzle assembly of claim 1.

19. (Currently Amended) A nozzle assembly for a home appliance, the nozzle assembly comprising:

a nozzle ~~configured to selectively spray~~that selectively sprays washing fluid in first and second directions, wherein the nozzle comprises:

a fixed central piece with one end in fluid communication with a fluid circulating device, and another end having first and second openings; and

first and second nozzles, each comprising:

a closed end and an open end, wherein the open end of the first and second nozzles is rotatably coupled to the first and second openings of the fixed central piece;

first and second surfaces extending between the open and closed ends of each of the first and second nozzles; and

a plurality of holes formed along the first surfaces of the first and second nozzles, wherein the plurality of holes are in fluid communication with the fixed central piece through the respective open ends so as to allow washing fluid to be sprayed therethrough, and wherein the first and second nozzles are ~~configured to rotate~~rotatable about a horizontal axis thereof while the fixed central piece remains ~~fixed~~stationary so as to adjust a position of the first surfaces of the first and second nozzles and the plurality of holes therein.

20. (Previously Presented) The nozzle of claim 19, wherein a manual rotation of one of the first or second nozzle sections about the horizontal axis causes a corresponding rotation of the other of the first or second nozzle sections such that the plurality of holes formed in the first and second nozzle sections are configured to all spray washing fluid in the same direction based on a rotational position of the first and second nozzle sections relative to the fixed central piece.

21. (New) The nozzle of claim 1, wherein the first nozzle sprays washing fluid in only the first rack direction in the first mode, and only in the second rack direction in the second mode.

22. (New) The nozzle of claim 2, wherein the fixed central piece has two open ends, and wherein the first nozzle comprises first and second nozzle sections in communication with the fixed central piece, wherein the first and second nozzle sections each have a closed end and an open end, and wherein the open end of each nozzle section is detachably coupled to one of the two open ends of the fixed central piece.

23. (New) The nozzle of claim 22, wherein changing from the first mode to the second mode is done by detaching the first and second nozzle sections from the fixed central piece, and re-attaching the first and second nozzle sections to the fixed central piece such that an orientation of the first and second nozzle sections is rotated 180° about a respective horizontal axis thereof.

24. (New) The nozzle of claim 14, wherein the plurality of injection holes are formed only in the first side such that washing fluid is sprayed only toward the first rack or only toward the second rack based on the orientation of the holes.

25. (New) The nozzle of claim 19, wherein the second surfaces of the first and second nozzles are continuous such that washing fluid cannot pass therethrough.
